Unprecedented Challenges
Screening during the COVID-19 pandemic
What’s happening with CRC screening now?

- Postponed
- Patient Fear
- Reduced Capacity

What could the reduction in CRC screening mean?

Modeled Estimates

► **9.5 Million** CRC Screenings Conducted Annually

► **72%** fewer screenings

► **90%** drop in colonoscopies

► **1.7 Million** fewer colonoscopies over 3 months

► **18,800** delayed CRC diagnoses

CRC Deaths are Associated with Failure to Screen

76% of CRC deaths occurred in patients who were not up to date with screening

(As seen in Kaiser system patients who died of CRC between 2006 and 2012.)

Action is Necessary

- Losing gains made in CRC screening
- Avoidable cancers and deaths
- Screening backlog
mt-sDNA:
A Stool-Based DNA Screening Option for Patients at Average Risk of CRC

mt-sDNA=multitarget stool DNA. CRC=colorectal cancer.
Cologuard (mt-sDNA): Indications and Contraindications

**Indications for Use**

Cologuard is intended for the qualitative detection of colorectal neoplasia associated DNA markers and for the presence of occult hemoglobin in human stool. A positive result may indicate the presence of colorectal cancer (CRC) or advanced adenoma (AA) and should be followed by diagnostic colonoscopy. Cologuard is indicated to screen adults of either sex, 45 years or older, who are at typical average-risk for CRC. Cologuard is not a replacement for diagnostic colonoscopy or surveillance colonoscopy in high risk individuals.

**Contraindications**

Cologuard is intended for use with patients, age 45 years and older, at average risk who are typical candidates for CRC screening. Cologuard was not clinically evaluated for the following types of patients:

- Patients with a history of colorectal cancer, adenomas, or other related cancers.
- Patients who have had a positive result from another colorectal cancer screening method within the last 6 months.
- Patients who have been diagnosed with a condition that is associated with high risk for colorectal cancer. These include but are not limited to: Inflammatory Bowel Disease (IBD), Chronic ulcerative colitis (CUC), Crohn’s disease, Familial adenomatous polyposis (FAP), Family history of colorectal cancer.
- Patients who have been diagnosed with a relevant familial (hereditary) cancer syndrome, such as Hereditary non-polyposis colorectal cancer syndrome (HNPCCC or Lynch Syndrome), Peutz-Jeghers Syndrome, MYH-Associated Polyposis (MAP), Gardner’s syndrome, Turcot’s (or Crail’s) syndrome, Cowden’s syndrome, Juvenile Polyposis, Cronkhite-Canada syndrome, Neurofibromatosis, or Familial Hyperplastic Polyposis.

mt-sDNA=multitarget stool DNA. IBD=inflammatory bowel disease.
Cologuard (mt-sDNA): Warnings and Precautions

The performance of Cologuard has been established in a cross-sectional study (i.e., single point in time). Programmatic performance of Cologuard (i.e., benefits and risks with repeated testing over an established period of time) has not been studied. Performance has not been evaluated in adults who have been previously tested with Cologuard. Non-inferiority or superiority of Cologuard programmatic sensitivity as compared to other recommended screening methods for CRC and AA has not been established.

The clinical validation study was conducted in patients 50 years of age and over. ACS Guidelines recommend screening begin at age 45. Cologuard performance in patients ages 45 to 49 years was estimated by sub-group analysis of near-age groups.

CRC screening guideline recommendations vary for persons over the age of 75. The decision to screen persons over the age of 75 should be made on an individualized basis in consultation with a healthcare provider. Cologuard test results should be interpreted with caution in older patients as the rate of false positive results increases with age.

A negative Cologuard test result does not guarantee absence of cancer or advanced adenoma. Patients with a negative Cologuard test result should be advised to continue participating in a colorectal cancer screening program with another recommended screening method. The screening interval for this follow-up has not been established.

Cologuard may produce false negative or false positive results. A false positive result occurs when Cologuard produces a positive result, even though a colonoscopy will not find cancer or precancerous polyps. A false negative result occurs when Cologuard does not detect a precancerous polyp or colorectal cancer even when a colonoscopy identifies the positive result.
Patients should not provide a sample for Cologuard if they have diarrhea or if they have blood in their urine or stool (e.g., from bleeding hemorrhoids, bleeding cuts or wounds on their hands, rectal bleeding, or menstruation).

To ensure the integrity of the sample, the laboratory must receive the patient specimens within 72 hours of collection. Patients should send stool samples to the laboratory according to the instructions stated in the Cologuard Patient Guide.

Patients should be advised of the caution listed in the Cologuard Patient Guide. Patients should NOT drink the preservative liquid.

The risks related to using the Cologuard Collection Kit are low, with no serious adverse events reported among people in a clinical trial. Patients should be careful when opening and closing the lids to avoid the risk of hand strain.
Guidelines Recommend Routine CRC Screening for Persons Aged 50-75 Years

**US Preventive Services Task Force (USPSTF) 2016**¹

**American Cancer Society (ACS) 2018**²*

**National Comprehensive Cancer Network® (NCCN®) ** 2020³

**US Multi-Society Task Force (MSTF) 2017**⁴

*ACS recommends screening starting at age 45 years.

**All recommendations are category 2A unless otherwise indicated. NCCN makes no representations or warranties of any kind whatsoever regarding their content, use or application and disclaims any responsibility for their application or use in any way.

CRC=colorectal cancer.

Guidelines Recommend Offering Choice of CRC Screening Options to Help Improve Adherence$^1,2$

In shared decision making, health care providers:

- offer options
- describe their risks and benefits
- patients express their preferences and values$^3$

Evidence Demonstrated High Compliance With mt-sDNA and Follow-Up Diagnostic Colonoscopy¹

77 primary care physicians offered mt-sDNA to Medicare patients aged 50-85 who were at average risk of CRC and were noncompliant with CRC screening recommendations (N=393)*

Of the 393 previously noncompliant patients,

347 (88.3%) were compliant with mt-sDNA over 12 months

Patients with positive results on mt-sDNA were referred for follow-up diagnostic colonoscopy

96.1% compliance rate

Of the 51 patients with positive mt-sDNA results,

49 (96.1%) were compliant with follow-up colonoscopy over 12 months

88.3% compliance rate

*Noncompliance with CRC screening recommendations was defined as >10 years since last colonoscopy and/or >1 year since last FOBT.

mt-sDNA=multitarget stool DNA. EHR=electronic health record. CRC=colorectal cancer. FOBT=fecal occult blood test.

mt-sDNA Is Included in Major Quality Measures, Making It Part of the Standard of Care for CRC Screening

✓ MACRA¹ | Medicare Access and CHIP Reauthorization Act of 2015

✓ Medicare Advantage Stars Rating Program²

✓ eCQM³ | Electronic Clinical Quality Measures

✓ UDS⁴ | Health Resources and Services Administration Uniform Data Set

✓ HEDIS®⁵ | Healthcare Effectiveness Data and Information Set

“At Exact Sciences, we know that cancer doesn’t stop for anything.

As we continue to monitor the Coronavirus (COVID-19) pandemic, our team remains steadfast in our commitment to delivering answers to patients around the world who need our tests.”

Kevin Conroy
Chairman & CEO, Exact Sciences
Today we seek to answer questions that have emerged about recommending Cologuard® during the COVID-19 outbreak.
What does a positive Cologuard® result mean in the current COVID-19 environment?

- A positive Cologuard result is not a diagnosis of cancer or precancer.
- In the pivotal Cologuard study of 10,000 patients, 16% of the patients had a positive result with the following distribution of findings:

  - 4% had CRC
  - 20% had advanced precancer
  - 31% had non-advanced precancer
  - 45% had no cancer or precancer

In the same clinical study,
- 84% of patients had a negative result.
- Of those patients, there was a 99.94% chance that no CRC was present.

Hypothetical Estimate of CRC Screening Backlog Reduction

9 out of 10

Cologuard®

• 1,000 tests
• 66% compliance rate*
• 554 negative results
• 106 follow-up colonoscopies
